# SYNCING YOUR JAMF ASSETS WITH 4ME

Sync your macOS, iOS and tvOS devices that are managed in Jamf to 4me's CMDB.

The 4me Jamf app enables organizations operating in the Apple ecosystem to synchronize their macOS, iOS, and tvOS devices managed by Jamf with 4me's CMDB. This integration allows organizations to centrally manage the entire lifecycle of their devices within 4me, including those obtained from Jamf. By providing specialists with the necessary information, it empowers them to efficiently carry out their service desk operations.

The App will import the devices registered in Jamf to 4me as configuration items (CIs) and also update these (imported devices) approx. every 8 hours.

ONCE THE ASSETS ARE SYNCED INTO 4ME ...

- ✔ Your configuration manager benefits from a unified view in 4me, encompassing all devices, including those obtained from Jamf.
- ✔ The tool assists your configuration managers in gaining valuable insights into asset lifecycle and inventory reports.
- ✔ By tagging assets to service requests and users, it facilitates the completion of the service fulfillment process.
- ✔ Improved visibility is achieved by identifying the devices owned by the end user, leading to a better understanding of their specific request.
- ✔ Your configuration managers gain enhanced insights into financial details such as costs, warranty status, and contract expiry information, pertaining to the assets.
